

Acknowledgements

Firstly I would like to thank the University of Glamorgan for giving me the opportunity to complete this thesis and the Sustainable Environmental Research Centre at the University for the use of the facilities and equipment to enable the work to be carried out. I would also like to thank Waters Inc. and the EPSRC funding body for financing the research. I would also like to thank staff of the chemistry / forensic departments and the University Research Office for their understanding at some challenging times for me. Thanks also go to other researchers who helped me through the difficult times.

This thesis was a long journey that started in the School of Applied Sciences at Treforest and finally ended in the Faculty of Health, Sport and Science at Glyntaf. Many an hour was spent in the laboratory and in front of computers and many times I thought it would not be finished. I did manage to get out and about, collecting samples from around South Wales though I was extremely surprised to see Llandegley International Airport in the heart of Wales close to Llandrindod Wells, it was a new one on me but unfortunately the destination and arrival boards will always empty.

I've always thought of the rivers of Wales as some of the cleanest in the UK, especially since the demise of heavy industry in the area but seeing a sheep's head in the River Ogmore about 10 yards from the source in the Bwlch Mountains of South Wales made me think again, especially when I wonder what happened to the rest of it.

A special thanks goes to my supervisors Paul Jones and Alan Guwy for their help and support throughout and Tony Davies without whose invaluable help with the numbers and other things, this thesis would not be possible.

Finally thanks to Mam and Dad but the biggest thanks of all goes to Catherine, Dafydd and Becky for their love and support in helping me through it all.
